

## **CLAIM (S):**

### **I Claim:**

A lightweight backpackers/mountaineers cot comprising a cot nylon fabric with siderail sleeves six cot legs; the two center legs being constructed to receive an ice ax as the center stay and four end legs constructed to receive the trekking poles as end stays of the cot. The siderails telescoping in nature are adapted from the internal frame backpack stays.

The siderails adjusted in length after removal from the internal frame backpack slid into the sidesleeves of the cot fabric. The siderails then are locked into the cot legs at the designated siderail receiver holes. The trekking poles are then adjusted from the trekking position length to the length that is appropriate for the end stays of the cot. The trekking poles are then fitted to the point of cot function. The ice ax is then fitted to the center legs and tightened to the proper tension and locked into place with the center leg ice ax shaft tightening screw. The six legs are specific for the reception of the particular end and center stay. There are two end legs that are designed to receive the point of the trekking pole and two legs designed to receive the handle of the trekking poles.

There is one center leg designed to receive the point of the ice ax and one center leg designed to receive the shaft of the ice ax. The center legs are also designed with a swivel bolt attached to the siderail receiver that allows the inclination of the cot to be adjusted by the user from lying to sitting position. In addition, there is an ice ax extender the allows the user to extend the length of their ice ax to the appropriate size in order to

properly fit the cot for use. The ice ax extender has a locking screw that will lock the extender to the ice ax for cot use.
